50 MHz Programmable Pulse Generators Models 4033 & 4034

The 4033 and 4034 are high performance programmable pulse generators for testing digital systems and circuits based on TTL, CMOS, or ECL technologies. Both instruments generate clean and accurate pulses at up to 6 digits resolution with a repetition rate up to 50 MHz, variable pulse widths from 10 ns to 10 s, and pulse delays from 0 ns to 10 s. Output levels are adjustable from -10 V to +10 V, with pulse amplitudes settable from 0.1 Vpp to 10 Vpp into a 50 ohm load. All parameters, modes, and functions are programmable via the front panel or remote control commands. Additionally, the pulse generators provide selectable complementary pulse and double pulse generation in continuous, triggered, gated, and counted burst modes.

Features & Benefits

- Repetition rate of 0.1 Hz to 50 MHz
- Flexible trigger modes: Continuous, Triggered (internal, external, manual), Gated Burst and External Width
- Pulse width programmable from 10 ns to 10 s
- Transition times (rise and fall times) variable from 6 ns to 100 ms
- Programmable delay and double pulse
- Predefined amplitude levels for ECL, TTL, and CMOS signals
- Store up to 99 different test setups with auto retention of last power down setup
- 10 Vpp into 50 ohm output
- Closed case calibration
- Programmable via GPIB and RS-232
- SCPI compatible
- Three year warranty

Dual-Channel Model 4034

- Both channels offer full functionality and all parameters such as pulse width and transition time can be set independently
- Synchronize both channels with the push of a button
- Saves cost and bench space

Applications

- Automatic Test Equipment (ATE)
- Avionics and radar testing
- Switching power supply testing
- Characterization of active components

Industry Leading Performance

External Width

In the external width pulse mode, pulse period and width are determined by an externally applied signal. The pulse generator then applies transition and level parameters to this signal in order to generate the pulse. A power supply designer for example could use this feature to shape the width and period of the output signal to drive the power supply's FET transistors while remaining synchronized with its control circuits.

Variable Transitions

For added flexibility, variable rise and fall times can be programmed from 6 ns to 100 ms. Various shapes of pulses can be obtained for applications where parameters such as linearity, switching times, or reflection times must be analyzed. Programmable rise and fall times could be used to measure operational amplifier slew rates and easily test thresholds of devices and circuits.

Straightforward User Interface

These generators use a menu-driven front panel keypad and control knob to adjust all parameters. The bright, easy-to-read display shows all relevant parameters along with a graphical representation of the output pulse. If an entered parameter is not compatible with the existing setup status, the operator is informed by an error message.

Users can conveniently select predefined amplitude levels for TTL, ECL, and CMOS signals, or choose a custom amplitude level for specialized applications.

Output On Button - Turns the

main output signal on or off

Specifications

The specifications describe the instrument performance after 30 minutes warm-up period into a 50 Ω load. All timing characteristics are measured at 50% of amplitude with fastest edges.

Models		4033	4034			
CHANNELS		I	2	TRANSITION TIMES		
FREQUENCY TIMING CHARACTERISTICS		0.1 Hz to 50 MHz		Range		<6 ns to 100 ms variable. Leading and trailing edges settable separately and limited to 20:1 ratio between settings into one of the following ranges: 5 ns-100 ns; 50 ns-1.0 us; 500 ns-10 us
	Range (single pulse)	e) 20 ns to 10 s (50 MHz to 0.1 Hz repetition rate)				5.0 us-100 us; 50 us-1.0 ms; 500 us-10 ms, 5 ms – 100 m
PERIOD	Range (double	40 ns to 10 s (25 MHz to 0.1 Hz repetition rate)		Resolution		3 digits limited to 10 ps
	pulse)			Accuracy		\pm (5% of setting +2 ns)
	Resolution	Up to 6 digits, limited to 100 ps		Linearity		<5% deviation from a straight line between 10% and 90% points, for transitions > 50 ns
	Accuracy	±0.01 %		INTERNAL TRIGGER		
	Jitter	< 0.01 % of setting + 20 ps on Period, Width and Delay		Range 100 ns to 100 s		
WIDTH	Range	$10 \text{ ns to (Period - 10 \text{ ns})}$		Resolution		4 digits limited to 100 ns
		Up to 6 digits, limited to 100 ps $\pm (0.5\% \text{ of extring} \pm 500 \text{ ps})$		Accuracy		±0.01%
	Accuracy	\pm (0.5% of setting +500 ps) \pm (0.5% of setting +3 ns) for the second pulse		INPUT AND OUTPUT		
	Double Pulse			Sensitivity		200 mVpp minimum
DELAY	Range	0 ns to (Period –			Minimum Width	10 ns
	Resolution	Up to 6 digits, lin			Maximum Rate	50 MHz
	Accuracy	±(0.5% of setting		TRUGGER	Input Impedance	10 kΩ
DUTY CYCLE	Range	I to 9		TRIGGER INPUT		
	Resolution	3 digits (Input Protection	±15V DC plus peak AC Selectable from -10 V to +10 V
	Accuracy	Limited by width an	d pulse accuracy		Range	
OUTPUT CHARACTERISTICS					Resolution	3 digits limited to 10 mV
AMPLITUDE	High Level Range	-9.90 V to +10 V (-19.80 V to +20 V			Slope Selection	Positive or Negative
	Low Level Range	-10 V to +9.90 V (-20 V to +19.80 V	into 50 Ω load	SYNC OUTPUT		A TTL level pulse at the programmed period. Output impedance is 50 Ω , protected against short circuit and up to ± 15 V accidental input. The high level is >2 V into 50 Ω and with 3. ns typical transition times.
	Amplitude Range		0.1 V to 10 V p-p into 50 Ω load REMOTE PROGRAMMING (20 V p-p max into open circuit) REMOTE PROGRAMMING		OGRAMMING	is typical transition times.
	Resolution	3 digits limited	i to 10 mV	Interface		GPIB and RS-232, IEEE-488.2 and SCPI compatible
	Accuracy	$\pm 1\%$ of setting ± 1	0 mV into 50 Ω	GPIB Function Codes		SH1, AH1, T6, L4, SR1, RL1, PP0, DC1,DT1, C0, E2
	Aberrations	$<$ 5% + 20 mV into 50 Ω load,	for pulse levels between $\pm 5V$	GENERAL		
	Output Resistance	50 \$	2	Memory		Non-volatile, stores up to 99 complete panel settings. Last use
	Offset Accuracy	±1% ±2	25 mV			setup also retained at power down.
OPERATING MODES				Power Requirements		100-240 V, ±10%, 48-66 Hz, 50 VA maximum
Continuous		Output continuous at programmed period rate		Dimensions WxHxD		8.4 x 11.8 x 3.5 inches (213 x 300 x 88 mm)
Triggered		Output quiescent until triggered by an internal, external, GPIB or manual trigger, then generates one cycle at programmed period rate		EMC		6.61 lbs (3 kg) Conforms to EN55011 class B for radiated and conducted emissions
Gated Burst		Same as triggered mode except pulses are output for the dura- tion of the gated signal. The last cycle started is completed Same as triggered mode for programmed number of cycles from 2 to 999,999 as set by the N-BURST function		Electrical Discharge Immunity		Conforms to EN55082
				Safety Specifications		Conforms to EN61010, CE Approved
				Operating Temperature		32 °F to 122 ° F (0 °C to 50 °C)
External Width		Trigger duration and rate sets pulse width and repetition		Storage Temperature		-4 ° F to 140 °F (-20 °C to 60 °C)
PULSE FUNCTIONS				Humidity		90% RH at 32 °F to 86 °F (0 °C to 30 °C)
Single		One pulse at each selected period	l up to 50 MHz repetition rate			Three Year Warrant
Double		One pair of pulses at each period Both pulses have the same sel the second pulse set b	up to 25 MHz repetition rate. ected width; the position of	Included accessories : AC Power cord, CD containing instruction manual, RS-232 cable, test report and certificate of calibration
